

# **PORABLE EXPANSION APPARATUS FOR DIGITAL CAMERA**

## **ABSTRACT**

A portable expansion apparatus for digital camera includes a body which has a  
5 wireless communication means located therein, a screw mounted on an outer surface of  
the camera and a connection cable which has one end electrically connected with the  
wireless communication means. When the apparatus is assembled to the digital camera,  
the screw is engaged with a screw bore located in the digital camera, the connection  
cable has another end plugged in a signal jack located in the digital camera for linking to  
10 a memory unit of the digital camera so that images stored in the memory unit may be  
transmitted through the connection cable to other wireless communication enabled  
devices. Hence the digital camera which originally does not have wireless  
communication function may equip wireless transmission capability through this  
invention.
